

CARBON FIBER TECHNOLOGY FACILITY

Demonstrating Innovative
Low-Cost Carbon Fiber for Energy
and National Security Applications

Why Low-Cost Carbon Fiber?

- **Energy Independence**
Increase the nation's investment in energy technologies for a more sustainable energy future
- **US Manufacturing**
Spur the development and growth of existing and new US carbon fiber and composites
- **Job Growth**
Seed regional and national job growth and economic development

Innovation in Carbon Fiber Production

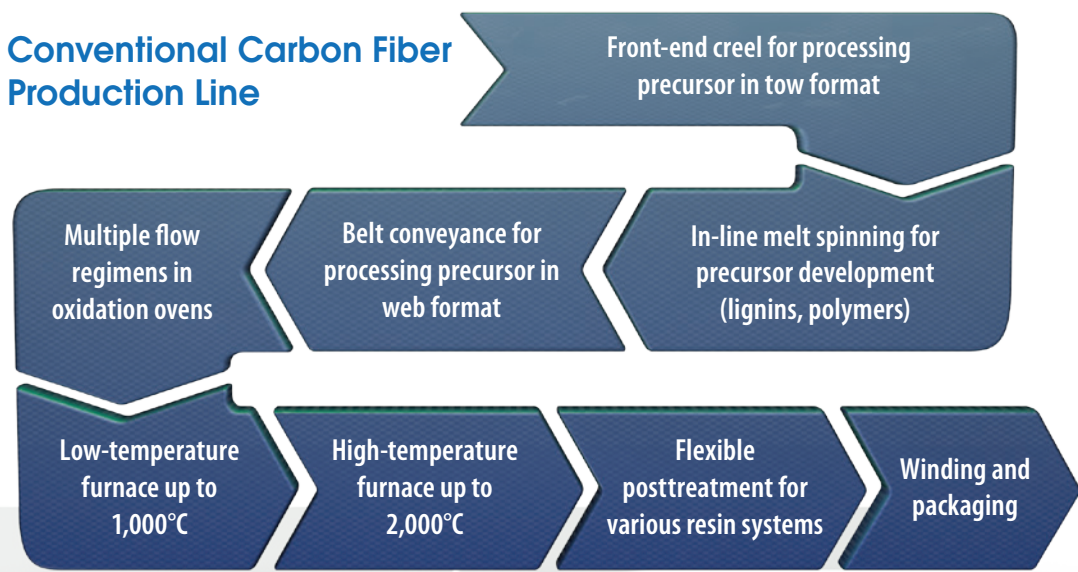

Carbon fiber is a strong, stiff, lightweight enabling material for improved performance in many applications. However, its use in cost-sensitive, high-volume industrial applications such as automobiles, wind energy, oil and gas, and infrastructure is limited because of today's relatively high price. Current methods for manufacturing carbon fiber and carbon-fiber-reinforced composite structures tend to be slow and energy intensive. New, innovative manufacturing processes for low-cost precursor development and conversion technologies hold the key to reducing carbon fiber cost for energy applications. Similarly, innovative performance-focused materials and processes can potentially drive significant performance improvements for national security applications.

Role of the Carbon Fiber Technology Facility

- Demonstrate low-cost carbon fiber technology scalability with the last scaling step before full-scale commercial production
- Produce development quantities of low-cost carbon fiber needed for large-scale material and process evaluations and prototyping
- Deploy a training system, including educational internships and industrial training and recertification, for developing the future carbon fiber workforce

Conventional Carbon Fiber Production Line

Semiproduction-Scale Carbon Fiber Pilot Plant

As the nation's leader in low-cost carbon fiber research and development, Oak Ridge National Laboratory's (ORNL's) new Carbon Fiber Technology Facility (CFTF) is capable of custom unit operation configuration and has a capacity of up to 25 tonnes/year with its 390-foot long processing line, allowing industry to validate conversion of its carbon fiber precursors at semiproduction scale. The new facility houses a thermal (conventional) conversion line and a melt-spinning precursor fiber production line and includes space for a future advanced conversion line.

Thermal (Conventional) Conversion Line

The thermal conversion line is rated for 25 tonnes/year of polyacrylonitrile (PAN)-based fiber and can convert both melt-spun and solution-spun precursors. It is baselined for standard modulus PAN but designed with the flexibility to accommodate lignin, polyolefin, and pitch precursors and can be readily upgraded to convert rayon and high modulus PAN precursors. It is designed to process materials in either tow or web forms.

Melt-Spun Precursor Fiber Production Line

The melt-spinning line is rated at 65 tonnes/year of polyethylene fiber and designed to also spin lignin and pitch-based precursors in either tow or web form. It is upgradable to melt-spin PAN when the technology is sufficiently developed.

Advanced Technology Conversion Line

ORNL is currently developing advanced conversion technology based on microwave and plasma processing technologies. Provisions have been made for the future construction of an advanced technology line, similar in scale to the conventional conversion line, when the technologies are sufficiently mature for semiproduction-scale demonstration.

Working with ORNL

The CFTF is available to industrial collaborators throughout the value chain, with emphasis on the creation and execution of vertically integrated partnerships, but academia, national laboratories, government agencies, and nongovernmental organizations may also use the facility. Access is granted through various partnering mechanisms, and both proprietary and nonproprietary work can be conducted. All partnerships are conducted in compliance with statutory restrictions, specifically export control.

Oak Ridge Carbon Fiber Composites Consortium

The Oak Ridge Carbon Fiber Composites Consortium is a public-private partnership enabling a national network for innovations in manufacturing. The consortium's mission is to foster industry-government collaborations to accelerate the development and deployment of lower-cost carbon fiber materials and processes and create a new generation of strong, lightweight composite materials that will improve America's competitiveness.

Membership benefits include opportunities for

- *Participating in two annual membership events and technology progress briefings*
- *Building relationships with other companies across the carbon fiber composites value chain*
- *Providing market-based input to help accelerate the full-scale commercialization of low-cost carbon fiber composites*

*Learn more at
www.cfcomposites.org*

Carbon Fiber Composites

Consortium

Manufacturing Demonstration Facility

From concept to commercialization, ORNL's world-leading facilities and expertise enable research focused on reducing the energy intensity of US industry, supporting development of new products, and strengthening our nation's clean-energy economy to meet the commercial and national security needs of tomorrow.

For more information on the CFTF, contact

Lee McGetrick

Director, Carbon Fiber Technology Facility

Oak Ridge National Laboratory

PO Box 2008, MS 6186

Oak Ridge, TN 37831-6186
